Taylor Beeston

Hands-on Engineering Leader · AI Training & Code Evaluation (part-time contract)

Hands-on VP of Engineering with ~6 years of professional software engineering across TypeScript/Node, Rust, C++ and Ruby. I debug production systems, tune performance and mentor a distributed team, and I already evaluate and write code-focused LLM training data, including RLHF-style preference and rubric work. Available 15–20 hrs/week, fully remote, Pacific time.

Location: Washington (Pacific Time) · Remote

SKILLS

- **Core:** TypeScript / Node.js, Rust, React, code review, debugging & profiling, performance tuning, Git, CI/CD, Linux
- **Also:** C++, Ruby, shader programming, Python/Bash scripting, WASM, Redis, MongoDB, Neo4j, AWS Lambda
- **AI/ML:** RLHF-style preference ranking & rubric writing, LLM code evaluation, MLPs, convnets, basic computer vision, local AI video & image generation (RTX 4090, Wan2GP)

EXPERIENCE

Learning Economy Foundation (LearnCard), Remote

VP of Engineering (Mar 2022 – Present)
Software Engineer (Aug 2020 – Mar 2022)

- Lead hands-on engineering for **LearnCard**, an open-source lifelong-learning passport platform (large TypeScript/Node monorepo with Redis, MongoDB, Neo4j, AWS Lambda and Rust-based SSI/DID tooling).
- Cut **CI deployment time ~75%** by reworking build tooling and release paths, and migrated local builds from webpack/CRA to esbuild (**~100x faster**).
- Reduced a **3+ minute production query to under 5 seconds**, and cut initial load from **~15 s to a few hundred ms**.
- Built a translations microservice that took recurring spend from **$500+/month to negligible**.
- Helped migrate a Meteor monolith toward a modular frontend/backend architecture.
- Promoted to VP of Engineering; mentor **4–6 engineers** while still shipping code, debugging production and writing documentation.

AI Training & Code Evaluation, Freelance (multiple platforms)

Independent Contractor (Feb 2024 – Present)

- Evaluate and write code-focused LLM training data: check model-generated code for correctness, bugs, edge cases, security and style.
- Do RLHF-style preference and rubric work, ranking competing responses and writing clear, evidence-based justifications.

SELECTED PROJECTS

- **Claudeball** (taylorbeeston.github.io/claudeball): browser 3D baseball broadcast sim (TypeScript, three.js) built by orchestrating parallel Claude coding agents with per-task git worktrees and reviewer agents.
- **LearnCard** (github.com/learningeconomy/LearnCard): open-source credential and learning-record platform; engineering lead.
- **Rust SSI / DIDKit forks** (ssi, didkit): Rust/WASM decentralized-identity tooling, integrated as submodules in the LearnCard ecosystem.
- **Shader / GPU compute work** (image-colorizer): hand-written ray-marched SDF (signed distance field) shape rendering, and Image Colorizer, a Rust/WebGPU wallpaper recolorizer built heavily on compute shaders.
- **Orch3stra**: self-hosted AI filmmaking studio that turns a story and cast into a rendered short film using locally run video models through WanGP (Node.js, Python worker, FFmpeg).

EDUCATION

Liberty University: Web Development Certificate (4.0 GPA) 2019
